According to MacDonald ' s (1994) constraint based theory, processing difficulty only arises when two or more constraints have approximately equal activation resulting in competition. Constraints at the beginning of the sentence strongly activate one analysis but, disambiguating information encountered later on activates an alternative analysis, both possible analyses having equal activation competition results.

The Theory of Constraints is a methodology for identifying the most important limiting factor (i.e. constraint) that stands in the way of achieving a goal and then systematically improving that constraint until it is no longer the limiting factor. In manufacturing, the constraint is often referred to as a bottleneck.

Constraint programming is the use of constraints as a programming language to encode and solve problems. This is often done by embedding constraints into a programming language, which is called the host language.Constraint programming originated from a formalization of equalities of terms in Prolog II, leading to a general framework for embedding constraints into a logic programming language.

Often used are constraints on a finite domain, to the point that constraint satisfaction problems are typically identified with problems based on constraints on a finite domain. Such problems are usually solved via search , in particular a form of backtracking or local search .

A Systematic Literature Review of Constraint-Based Innovations: State of the Art and Future Perspectives. Abstract: The past two decades have seen a tremendous growth in innovation processes conceived under scarcity conditions with special focus on emerging markets and bottom of the pyramid (BOP) customers. However, evolving literature in this field has unfortunately resulted in a multitude of innovation approaches leading to terminology confusion and fragmented literature.

Intrapersonal constraints which are internal factors that influence preference of leisure, for example fear, safety concern and no interest. Interpersonal constraints, such as lack of companionship, arise from interactions with others. Structural constraints are external factors that are not interpersonal, such as lack of money and time.

In this paper, we presented a constraint-based method using multi-perspective declarative process mining, supporting healthcare personnel to model clinical processes by themselves. Inspired by openEHR, we classified event attributes into seven types, and each relationship between these types is represented in a Constrained Relationship Matrix.
