The external magnetism generated is similar to that created by a large bar magnet located inside the Earth's center.

The prevailing theory is that the magnetizing force comes from aligned electron spins and rotations of the magma

The magnetization of the system is determined as $M = \frac{1}{\mu_0} \left(\frac{\partial F}{\partial H} \right)$ (4) The most important experimentally measurable material dependent quantities that characterize the magnetic materials is the susceptibility (χ). Susceptibility can be determined now as:

In effective-field theories of magnetism, the energy levels of a small cluster of spins are determined exactly and the cluster is then assumed to exist in an effective magnetic field due to surrounding spins. As the cluster size is increased, the accuracy of the results improves slowly, but the computational

Magnetism and Magnetic Fields |

Boundless Physics

In a magnetic field, the magnetic moments

align and are magnetized in the direction of the applied field, reinforcing it.

Examples of paramagnetic materials include magnesium, molybdenum, lithium, and tantalum. Ferromagnetism:

Ferromagnetic materials can form permanent magnets and are attracted to magnets. A ferromagnet has unpaired

electrons, plus the magnetic moments of the electrons tend to remain aligned even when removed from a magnetic field.

What Is Magnetism? Definition, Examples, Facts

The magnetic field spreads out when it encounters the small air gap created by the

crack because the air cannot support as much magnetic field per unit volume as the magnet can. When the field spreads out, it appears to leak out of the material and, thus is called a flux leakage field. If iron particles are sprinkled on a cracked magnet, the particles will be attracted to and cluster not only at the poles at the ends

of the magnet, but also at the poles at the edges of the crack.
