(b) Feedback control system measures the controlled variable and compares the measured value with the desired value and then adjusts the manipulated variables for the control of the system accordingly.. Thus, the process variable to be controlled is measured in feedback control. Therefore, the provided statement is .

Feedback Control Systems, 5/e This text offers a thorough analysis of the principles of classical and modern feedback control. Organizing topic coverage into three sections--linear analog control systems, linear digital control systems, and nonlinear analog control systems--helps students understand the difference between mathematical models and the physical systems that the models represent.

An adaption of the introductory control text which covers analog systems only. The book describes several control systems and develops mathematical models of some common control system components.

This book presents the twin topics of singular perturbation methods and time scale analysis to problems in systems and control. The heart of the book is the singularly perturbed optimal control systems, which are notorious for demanding excessive computational costs. The book addresses both continuous control systems (described by differential equations) and discrete control systems (characterised by difference equations). Another feature is the extensive bibliography, which will hopefully be of great help for future study and research. Also of particular interest is the categorisation of an impressive record of applications of the methodology of singular perturbations and time scales (SPTS) in a wide spectrum of fields, such as circuits and networks, fluid mechanics and flight mechanics, biology and ecology and robotics.

"This book is the best source for the most current, relevant, cutting edge research in the field of industrial informatics focusing on different methodologies of information technologies to enhance industrial fabrication, intelligence, and manufacturing processes"--Provided by publisher.
