This standard specifies the limit requirements, measurement conditions, measurement methods, measurement techniques and evaluation methods of electromagnetic emissions from high-speed trains. This standard is applicable to the measurement of magnetic field emission in the frequency range of 0 kHz – 20 kHz (not including 0) inside high-speed trains and the external emission of high-speed trains in the frequency range of 9 kHz – 1 GHz. Electric locomotives, intercity and urban rail EMUs can be implemented with reference to this standard.

This manual describes applications of the multiconductor transmission-line computer program, NLINE. The program computes the voltages and currents induced by an incident plane electro-magnetic wave on the conductors or in the loads of a lossless transmission line made up of 11 conductors or less. The solution is provided both in the frequency and time domains. The program accepts arbitrary angles of incidence, transmission-line length, and resistive terminations. The Thevenin equivalent lumped-parameter method is described for use of NLINE with non-linear loads. Computational agreement with experimental data is demonstrated. A complete FORTRAN program listing is included. (Author).
