This new anthology includes both classic and contemporary readings on the methods and scope of science. Jeffrey Foss depicts science in a broadly humanistic context, contending that it is philosophically interesting because it has reshaped nearly all aspects of human culture—and in so doing has reshaped humanity as well. While providing a strong introduction to epistemological and metaphysical issues in science, this text goes beyond the traditional topics, enlarging the scope of philosophical engagement with science. Substantial introductions and critical questions are provided for each reading.

What does the birth of babies whose embryos had gone through genome editing mean—for science and for all of us? In November 2018, the world was shocked to learn that two babies had been born in China with DNA edited while they were embryos—as dramatic a development in genetics as the 1996 cloning of Dolly the sheep. In this book, Hank Greely, a leading authority on law and genetics, tells the fascinating story of this human experiment and its consequences. Greely explains what Chinese scientist He Jiankui did, how he did it, and how the public and other scientists learned about and reacted to this unprecedented genetic intervention. The two babies, nonidentical twin girls, were the first “CRISPR’d” people ever born (CRISPR, Clustered Regularly Interspaced Short Palindromic Repeats, is a powerful gene-editing method). Greely not only describes He’s experiment and its public rollout (aided by a public relations adviser) but also considers, in a balanced and thoughtful way, the lessons to be drawn both from these CRISPR’d babies and, more broadly, from this kind of human DNA editing—“germline editing” that can be passed on from one generation to the next. Greely doesn’t mince words, describing He’s experiment as grossly reckless, irresponsible, immoral, and illegal. Although he sees no inherent or unmanageable barriers to human germline editing, he also sees very few good uses for it—other, less risky, technologies can achieve the same benefits. We should consider the implications carefully before we proceed.

It is highly probable that the ability to distinguish between living and nonliving objects was already well developed in early prehuman animals. Cognizance of the difference between these two classes of objects, long a part of human knowledge, led naturally to the division of science into two categories: physics and chemistry on the one hand and biology on the other. So deep was this belief in the separateness of physics and biology that, as late as the early nineteenth century, many biologists still believed in vitalism, according to which living phenomena fall outside the confines of the laws of physics. It was not until the middle of the nineteenth century that Carl Ludwig, Hermann von Helmholtz, Emil DuBois-Reymond, and Ernst von Briicke inaugurated a physicochem ical approach to physiology in which it was recognized clearly that one set of laws must govern the properties and behavior of all matter, living and nonliving. . . The task of a biologist is like trying to solve a gigantic multidimensional crossword fill in the right physical concepts at the right places. The biologist depends on puzzle: to the maturation of the science of physics much as the crossword solver depends on a large and correct vocabulary. The solver of crossword puzzles needs not just a good vocabulary but a special vocabulary. Words like inee and oke are vitally useful to him but are not part of the vocabulary of an English professor.

Crucially, the foundations of good psychology, in both practice and knowledge, are the ability to understand and carry out effective methods in psychological research. Subsequently, this title aims to introduce students to a thorough history of the key psychological studies across the sub-disciplines of social, developmental, cognitive and biological psychology as well as neuroscience. Research case-studies are described and critiqued encouraging students to critically think about the wider implications of how research is conducted and the subsequent findings that they produce. The pivotal case studies covered have been specifically chosen to illustrate how psychological methods in research have evolved over the history of the discipline and to showcase as broad an overview as possible of the various ways in which research may be conducted; including controlled experiments, in-depth interviewing and literature searches. The book is essential for undergraduate students looking for a comprehensive and clearly written guide to both the classic and contemporary studies that have informed the research methods in the discipline of psychology today. This book has been written to provide clear and well-explained summaries that encourage critical reflection and discussion of the material learnt, making this an apt introduction for students wishing to learn about the valid methods of carrying out empirical research.

This volume documents the 17th Münster Lectures in Philosophy with Susan Haack, the prominent contemporary philosopher. It contains an original, programmatic article by Haack on her overall philosophical approach, entitled ‘The Fragmentation of Philosophy, the Road to Reintegration’. In addition, the volume includes seven papers on various aspects of Haack’s philosophical work as well as her replies to the papers. Susan Haack has deeply influenced many of the debates in contemporary philosophy. In her vivid and accessible way, she has made ground-breaking contributions covering a wide range of topics, from logic, metaphysics and epistemology, to pragmatism and the philosophy of science and law. In her work, Haack has always been very sensitive in detecting subtle differences. The distinctions she has introduced reveal what lies at the core of philosophical controversies, and show the problems that exist with established views. In order to resolve these problems, Haack has developed some ‘middle-course approaches’. One example of this is her famous ‘foundherentism’, a theory of justification that includes elements from both the rival theories of Foundationalism and Coherentism. Haack herself has offered the best description of her work calling herself a ‘passionate moderate’.
